P/N : HY-018(A) Name : Photosensitive Resistance Sensor Module

Image :

Introduction :

The photoresistor sensor is sensitive to ambient light and is generally used to detect the brightness and intensity of the surrounding environment. It can sense the light source in a fixed direction. It is connected to the controller and can read the ambient light intensity and can be made into a photoelectric switch.

Parameter :

Name : Photosensitive Resistance Sensor Module

Power : +3.0V -5.5V

Signal : Analog signal

Connector : XH2.54 × 3

Pin : S-Signal , V-Power , G-Ground

Instructions for use: Connect the power supply and read the analog quantity of the signal pin. The analog quantity is different according to the light intensity.
